## Artificial Intelligence Lab 1

### What to submit:

Your submission should include the following:

1. Lab report answers to the following questions:
  - a. Describe the behavior of **RandomAgent** from Step 7
  - b. A screen shot of your **myLayout** environment from Step 8
  - c. Describe the behavior of **RandomAgent** from Step 9
  - d. Describe the behavior of **ReflexAgent** from Step 10
  - e. For each of the percepts listed in Step 10, show what command/code enables you to access it. For example:  
Pac-man's position: `gameState.getPacmanPosition()`
2. Source code + README (how to compile and run your code)
3. Please create a folder called "yourname\_studentID" that includes all the required files and generate a zip file called "yourname\_studentID.zip".
4. Please submit your work (.zip) to Blackboard.

### 1. Lab report answers to the following questions:

- a.** Describe the behavior of **RandomAgent** from Step 7

*Figure 1: Step 7 result*

### Description:

Pacman only moves randomly around a small area on the right side of the screen. This could be because the random Agents results are evenly distributed, causing Pacman to not have consecutive similar results to go far. Another reason is that the random time interval is too short, causing Packman to not go far to the left side of the maze. It gets to the food randomly, it can win the game if lucky, which is clearer in the tinyMaze as figure3.

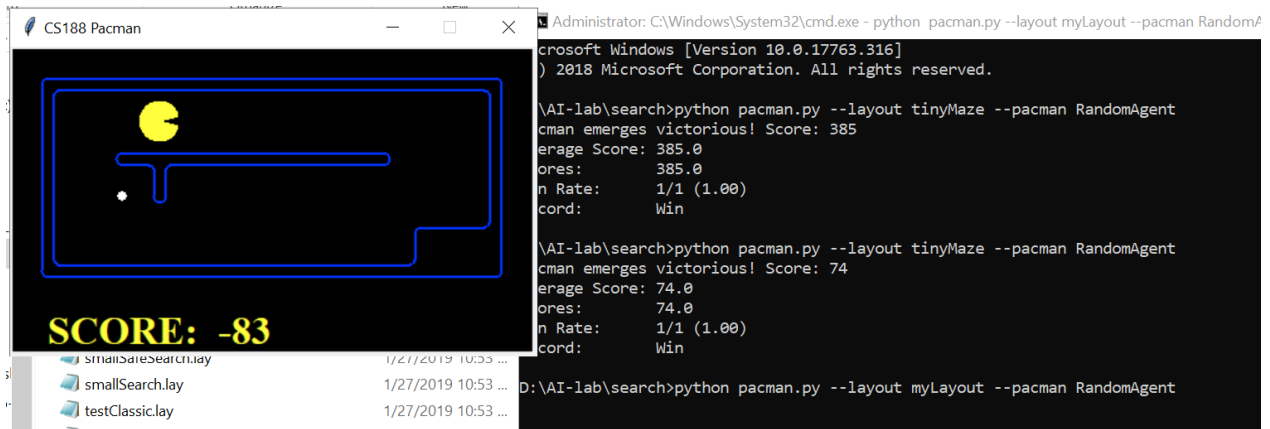

*Figure 2: The area where pacman moves during the first few minutes of running the program*

*Figure 3: The agent run in the tinyMaze environment*

**b.** A screen shot of your myLayout environment from Step 8

*Figure 4: The agent run in the myLayout environment*

*Figure 5: The agent run in the openSearch environment*

### Description:

Pacman moves and grabs food randomly. It moves through areas (where it has already visited and eaten food) multiple times. Sometimes it leaves one or a few dots of food and wanders around before coming back and grabbing them all.

D:\AI-lab\search>python pacman.py --layout openSearch --pacman RandomAgent
Pacman emerges victorious! Score: 353
Average Score: 353.0
Scores:      353.0
Win Rate:    1/1 (1.00)
Record:      Win

D:\AI-lab\search>python pacman.py --layout openSearch --pacman RandomAgent
Pacman emerges victorious! Score: 135
Average Score: 135.0
Scores:      135.0
Win Rate:    1/1 (1.00)
Record:      Win

D:\AI-lab\search>python pacman.py --layout openSearch --pacman RandomAgent
Pacman emerges victorious! Score: -484
Average Score: -484.0
Scores:      -484.0
Win Rate:    1/1 (1.00)
Record:      Win

D:\AI-lab\search>python pacman.py --layout openSearch --pacman RandomAgent
Pacman emerges victorious! Score: -1872
Average Score: -1872.0
Scores:      -1872.0
Win Rate:    1/1 (1.00)
Record:      Win

D:\AI-lab\search>python pacman.py --layout openSearch --pacman RandomAgent
Pacman emerges victorious! Score: 260
Average Score: 260.0
Scores:      260.0
Win Rate:    1/1 (1.00)
Record:      Win

D:\AI-lab\search>
```

*Figure 6: The results of running agent in the openSearch environment*

**Average score:**  $(353.0 + 135.0 - 484.0 - 1872.0 + 260.0)/5 = -321.6$

**C.** Describe the behavior of RandomAgent from Step 9

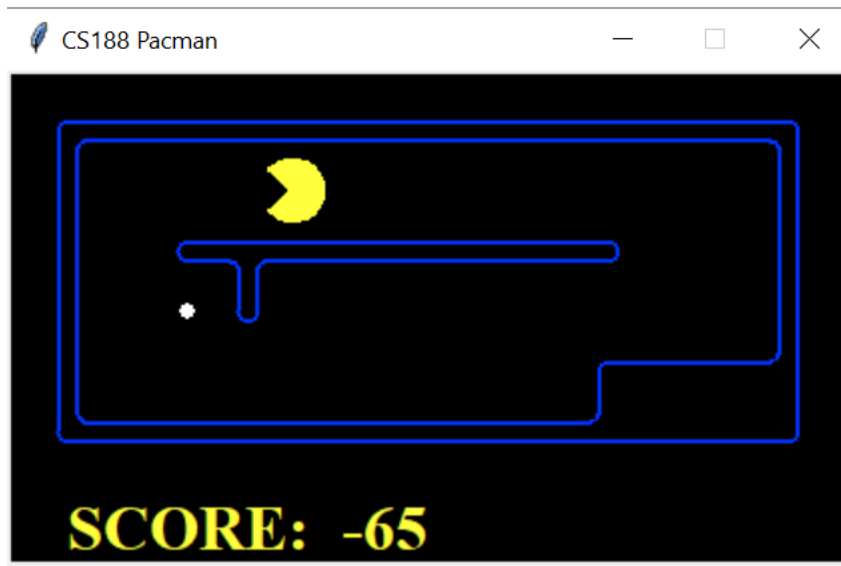

*Figure 7: BetterRandomAgent helps pacman collect foods faster than the RandomAgent because of reducing stop*

**d.** Describe the behavior of ReflexAgent from Step 10

*Figure 8: ReflexAgent run in the openSearch environment*

*Figure 9: ReflexAgent run in the myLayout environment*

- e.** For each of the percepts listed in Step 10, show what command/code enables you to access it. For example: Pac-man's position:  
`gameState.getPacmanPosition()`

Pac-Man can perceive:

- His position: `gameState.getPacmanPosition()`
- The position of all the ghosts: `gameState.getGhostPositions()`
- The locations of the walls: `gameState.getWalls()`
- The positions of the capsules: `gameState.getCapsules()`
- The positions of each food pellet: `gameState.getFood()`
- The total number of food pellets still available: `gameState.getNumFood()`
- Whether it has won or lost the game: `gameState.isWin()` and `gameState.isLose()`, respectively
- His current score in the game: `gameState.getScore()`
